Sales Clerk AI Assistant — End User Guide

Overview

Sales Clerk AI Assistant is a conversational AI tool that lets you manage SAP S/4HANA sales orders using plain English. Instead of navigating SAP menus and transaction codes, you simply type what you want — and the assistant takes care of the rest.

Whether you need to look up an order, create a new one, adjust quantities, or update payment terms, you can do it all through a simple chat interface in your web browser.

How It Works

```
You type a question or request
        |
        ▼
┌──────────────────────┐
|   Chat Interface     |  ← Web browser (SAPUI5)
|  (your browser)      |
└──────────┬───────────┘
           | your message
           ▼
┌──────────────────────┐
|   AI Agent           |  ← Understands your intent
|   (GPT-4o via        |     Decides which SAP action to take
|    SAP AI Core)      |     Remembers your conversation
└──────────┬───────────┘
           | reads / writes data
           ▼
┌──────────────────────┐
|   SAP S/4HANA        |  ← Your live sales order data
|   Sales Orders API   |
└──────────────────────┘
```

Your conversation is remembered within each session — you can ask follow-up questions like *"show me the details of the third one"* and the assistant will understand what you mean.

Accessing the Application

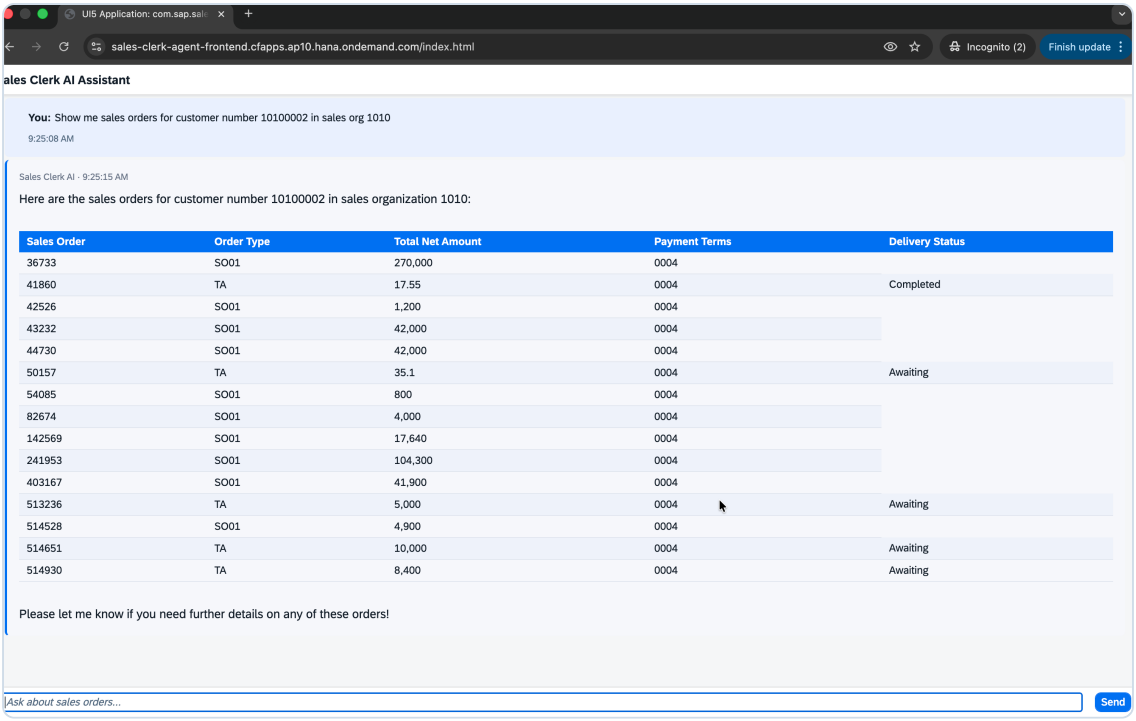
1. Open your browser and go to the URL provided by your administrator

2. You will be redirected to the **company login page** — sign in with your usual corporate credentials
3. After login you will see the **Sales Clerk AI Assistant** chat screen

> **Note:** You need a valid company account. Contact your IT administrator if you cannot log in.

The Chat Interface

After login you will see a chat screen. Type your question in the input box at the bottom and press **Send** (or hit Enter). The assistant responds with formatted results — including tables when listing multiple orders.



Example: asking for all sales orders for a customer returns a formatted table with order numbers, types, amounts, payment terms, and delivery status.

What You Can Do

1. List Sales Orders

Search for orders by customer or sales organization. The assistant returns up to 20 orders at a time.

Example questions
Show me all sales orders for customer 10100002
List orders in sales organization 1710
Show orders for customer 10100001 in sales org 1010

---

2. View Order Details

Get full details of a specific order, including all line items.

Example questions
Show me the details of order 36733
What are the line items in sales order 41860?
Get order 514930 with all items

The detail view includes: order type, customer, sales organization, total amount, delivery status, payment terms, and each product line with quantities and delivery dates.

---

3. Create a Sales Order

Ask the assistant to create an order. It will ask you for any missing information before creating.

Example requests
Create a standard order for customer 10100001 in sales org 1710 for 5 units of product TG11
I need a new sales order — order type OR, customer 10100002

Required information the assistant will ask for if not provided:
- Order type (e.g. `OR` for standard order)
- Sales organization (e.g. `1710`)
- Distribution channel (e.g. `10`)
- Division (e.g. `00`)
- Customer number (sold-to party)
- At least one product with a quantity

> **The assistant will always confirm before creating an order.**

---

4. Update an Order Item

Change the quantity or requested delivery date of a line item.

Example requests
Update order 36733 item 10 — change quantity to 8
Set the delivery date for order 41860 line 10 to June 30 2025
Change item 000020 of order 514930 to 3 EA

5. Update Order Header

Change payment terms on an existing order.

Example requests
Update order 36733 payment terms to NT30
Change the payment terms on order 82674 to 0001

6. Delete a Sales Order

Remove an order that is no longer needed.

Example requests
Delete sales order 514930
Remove order 41860

> **Important:** The assistant will always ask you to confirm before deleting. Deletion cannot be undone. Only orders that have **not yet been delivered or billed** can be deleted.

Tips for Best Results

Be specific about order numbers
The assistant works best when you provide exact sales order numbers. If you don't know the number, ask it to list orders for your customer first.

Use customer numbers, not names
SAP identifies customers by number (called "sold-to party"). If you only know the customer name, ask your administrator for the customer number.

> *"What's the customer number for ACME Corp?"* — the assistant cannot look this up, but can help once you have it.

Ask follow-up questions

Your conversation history is kept throughout the session. You can refer back naturally:

- *"Show me orders for customer 10100002"*
- *"Open the second one"*
- *"Update item 10 — change the quantity to 5"*

Common SAP terms

Term	What it means
Sold-to party	The customer who placed the order (customer number)
Sales organization	The unit responsible for the sale (e.g. 1710)
Distribution channel	How the goods are delivered to the customer (e.g. 10)
Division	The product group or line (e.g. 00)
Payment terms	When payment is due (e.g. NT30 = net 30 days, 0001 = immediate)
Delivery status	Whether the order has been shipped (A = not started, C = complete)

Frequently Asked Questions

The assistant says it can't find a customer. What should I do?

Make sure you are using the numeric customer number (sold-to party), not the customer name. Example: `10100001` not `ACME Corp`.

Can I see orders from previous sessions?

No — conversation memory resets each time you open a new browser tab or reload the page. The order data in SAP is always up to date, but you will need to re-ask your questions.

The assistant is slow to respond. Is that normal?

Yes, for complex requests it may take a few seconds while it queries SAP. A response typically arrives within 5–10 seconds.

I got an error message. What should I do?

The assistant will describe the error and suggest next steps. Common causes:

- The order number does not exist
- The order is already delivered or billed (cannot be changed or deleted)
- You do not have permission to perform the action in SAP

If the problem continues, contact your SAP administrator.

Can the assistant do things I am not allowed to do in SAP?

No. All actions go through your SAP user account and respect your existing SAP authorizations.

Getting Help

If you experience issues, contact your IT support team and provide:

- The URL of the application
- What you typed and what response you received
- The approximate time of the issue
